

Dry Creek Work Program

NOTE: Each earthen dam requires a specific size drain pipe on the original creek bed so the entire reservoir will drain. (no gate valve is used, because we need this water flowing and for valley agriculture). Thus the smaller upper dams will drain totally, while the larger dams will support flows in the lower half of the same dry creek. To protect dams from extra high runoff, each dam requires a large overflow spillway pipe or concrete spillway.

- # **The Enclosed Dry Creek Work Program is for earthen dam construction on dry creeks only!! There will be no dams constructed on all season streams or rivers.**

- (Definition of a dry creek: A creek bed which is totally dry for at least 30 days of the year.)
